

# Service Manual

## COLOR TELEVISION

### CHASSIS : CP-520

MODEL : DTY-28A8/28A6/28A7

DTY-2880/28W5

DTY-21U7/21B4

DTY-25G6/25G7

### CHASSIS : CP-520A

MODEL : DTC-20T2

DTC-21Y1/21Y2

### CHASSIS : CP-520F

MODEL : DTZ-29U7/U3

DTZ-2881/28W8

DTZ-2481

#### Caution

: In this Manual, some parts can be changed for improving. their performance without notice in the parts list. So, if you need the latest parts information, please refer to PPL(Parts Price List)in Service Information Center(<http://svc.dwe.co.kr>)

DAEWOO ELECTRONICS Corp.

V1.00	12/05/04	Creation of document (Author JS KIM) for project CP520 50Hz TV.

## 1 MAIN FEATURES

### 1.1 SPECIFICATIONS

#### 1.1.1 GENERAL

TV standard		PAL - SECAM B/G D/K, PAL I/I, SECAM L/L'
Colour system	Tuner	PAL, SECAM
	AV	PAL, SECAM, PAL 60, NTSC M, NTSC 4.43
Sound system		NICAM B/G, I, D/K, L, FM 2Carrier B/G, D/K
Power consumption		20", 21" : 49W 21" (4:3) Flat : 59W 28" (4:3) : 69W 28" (16:9) : 69W
Sound Output Power		20" ~ 24" : 4.5W x 2 (at 60% mod, 10% THD) 25" ~ 29" : 7W x 2 (at 60% mod, 10%THD)
Speaker		20" ~ 24" : 7.5W 8 ohm x 2 25" ~ 29" : 12W 8 ohm x2
Teletext system		10 pages memory FASTEXT (FLOF or TOP)
Aerial input		75 ohm unbalanced
Channel coverage		Off-air channels, S-cable channels and hyperband
Tuning system		frequency synthesiser tuning system
Visual screen size		20" : 48cm 21" : 51cm 28" : 66cm
Channel indication		On Screen Display
Program Selection		100 programmes
Aux. terminal		EURO-SCART 1 : Audio / Video In and Out, R/G/B In, Slow and Fast switching. EURO-SCART 2 : Audio / Video In and Out, SVHS In. AV3 : Audio-Video Jack on front of cabinet. Headphone jack (3.5 mm) on front of cabinet SVHS3 (option) : Jack on front of cabinet – sound input common with AV3.
Remote Control Unit		R-46G22

#### 1.1.2 EURO-SCART 1 (21 Pin)

Pin	Signal Description	Matching value
1	Audio Output Right	0.5 Vrms, Impedance < 1 k $\Omega$ , ( RF 54% Mod )
2	Audio Input Right	0.5 Vrms, Impedance > 10 k $\Omega$
3	Audio Output Left	0.5 Vrms, Impedance < 1 k $\Omega$ , ( RF 54% Mod )
4	Audio Earth	
5	Blue Earth	
6	Audio Input Left	0.5 Vrms, Impedance > 10 k $\Omega$
7	Blue Input	0.7 Vpp $\pm$ 0.1V, Impedance 75 $\Omega$

8	Slow Switching	TV : 0 to 2V, AV 16/9 : 4.5 to 7V, AV 4/3 : 9.5 to 12V , Impedance > 10 k $\Omega$
9	Green Earth	
10	N.C.	
11	Green Input	0.7 Vpp $\pm$ 0.1V, Impedance 75 $\Omega$
12	N.C.	
13	Red Earth	
14	Blanking Earth	
15	Red Input	0.7 Vpp $\pm$ 0.1V, Impedance 75 $\Omega$
16	Fast Switching	0 to 0.4V : Logic "0", 1 to 3V : Logic "1", Impedance 75 $\Omega$
17	Video Out Earth	
18	Video In Earth	
19	Video Output	1 Vpp $\pm$ 3dB, Impedance 75 $\Omega$
20	Video Input	1 Vpp $\pm$ 3dB, Impedance 75 $\Omega$
21	Common Earth	

### 1.1.3 EURO-SCART 2 (21 Pin)

Pin	Signal Description	Matching value
1	Audio Output Right	0.5 Vrms, Impedance < 1 k $\Omega$ , ( RF 54% Mod )
2	Audio Input Right	0.5 Vrms, Impedance > 10 k $\Omega$
3	Audio Output Left	0.5 Vrms, Impedance < 1 k $\Omega$ , ( RF 54% Mod )
4	Audio Earth	
5	Earth	
6	Audio Input Left	0.5 Vrms, Impedance > 10 k $\Omega$
7	N.C.	
8	N.C.	
9	N.C.	
10	N.C.	
11	N.C.	
12	N.C.	
13	Earth	
14	Earth	
15	Chroma Input	$\pm$ 3dB for a luminance signal of 1 Vpp
16	N.C.	
17	Earth	
18	Video In Earth	
19	Video Output	1 Vpp $\pm$ 3dB, Impedance 75 $\Omega$ ( Monitor output )
20	Video Input, Y In.	1 Vpp $\pm$ 3dB, Impedance 75 $\Omega$
21	Common Earth

## **2 SAFETY INSTRUCTION**

**WARNING:** Only competent service personnel may carry out work involving the testing or repair of this equipment.

### **X-RAY RADIATION PRECAUTION**

1. Excessive high voltage can produce potentially hazardous X-RAY RADIATION. To avoid such hazards, the high voltage must not exceed the specified limit. The nominal value of the high voltage of this receiver is 25-26 KV (20" -21" ) or 26 KV (25" - 28" ) at max beam current. The high voltage must not, under any circumstances, exceed 27.5 KV (20" ), 29KV (21" ), 29.5 KV (25" ) or 30 KV (28" ). Each time a receiver requires servicing, the high voltage should be checked. It is important to use an accurate and reliable high voltage meter.
2. The only source of X-RAY Radiation in this TV receiver is the picture tube. For continued X-RAY RADIATION protection, the replacement tube must be exactly the same type tube as specified in the parts list.

### **SAFETY PRECAUTION**

Potentials of high voltage are present when this receiver is operating. Operation of the receiver outside the cabinet or with the back board removed involves a shock hazard from the receiver. Servicing should not be attempted by anyone who is not thoroughly familiar with the precautions necessary when working on high voltage equipment.

Discharge the high potential of the picture tube before handling the tube. The picture tube is highly evacuated and if broken, glass fragments will be violently expelled.

If any Fuse in this TV receiver is blown, replace it with the FUSE specified in the Replacement Parts List.

When replacing a high wattage resistor (metal oxide film resistor) in the circuit board, keep the resistor 10 mm away from circuit board.

Keep wires away from high voltage or high temperature components.

This receiver must operate under AC 230 volts, 50 Hz. NEVER connect to a DC supply or any other voltage or frequency.

### **PRODUCT SAFETY NOTICE**

Many electrical and mechanical parts in this equipment have special safety-related characteristics. These characteristics are often passed unnoticed by a visual inspection and the X-RAY RADIATION protection afforded by them cannot necessarily be obtained by using replacement components rated for higher voltage, wattage, etc. Replacement parts which have these special safety characteristics are identified in this manual and its supplements, electrical components having such features are identified by designated symbol on the parts list. Before replacing any of these components, read the parts list in this manual carefully. The use of substitutes replacement parts which do not have the same safety characteristics as specified in the parts list may create X-RAY Radiation.

### 3 ALIGNMENT INSTRUCTIONS

#### 3.1 MICROCONTROLLER CONFIGURATION : SERVICE MODE

To switch the TV set into service mode please see instruction below.

- 1 - Select PR. number 91
- 2 - Adjust sharpness to minimum and exit all menus.
- 3 – Within 2 seconds press the key sequence : **RED - GREEN - menu**

The software version is displayed beside the word Service, e.g. “SERVICE VER 00.05”.

To exit SERVICE menu press **menu** key or **Std By** key.

#### 3.2 SERVICE MODE NAVIGATION

- Pr Up/Down remote keys : cycle through the service items available.  
 Vol +/- remote keys : Dec./Increment the values within range – Cycle through option bits.  
 OK key : Toggle bits in option byte

21	VERT CENT	
22	VERT SIZE	

#### 3.3 MICROCONTROLLER CONFIGURATION : OPTION BITS

There are two option bytes available (16 bits in all). These option bits are available from Service mode. First find the OPTION1 or OPTION2 control, and then use the Volume PLUS/MINUS buttons on the remote control keypad to locate the bits, and OK key to toggle them. The table below shows the two option bytes available;

3.4 OPTION 1

	B7	B6	B5	B4	B3	B2	B1	B0
1	TOP Teletext OFF	FASTEXT (FLOF) OFF	TUBE 4:3	VAI bit set to 1 in SECAM L	Dolby Virtual OFF	SVHS3 disable	<b>TUNER OPTIONS</b> 00 = Philips 01 = Not used 10 = Alps 11 = Parstnic (DW)	
0	TOP Teletext ON	FASTEXT (FLOF) ON	TUBE 16:9	VAI bit set to 0 in SECAM L	Dolby Virtual ON	SVHS3 enable		

3.5 OPTION 2

	B7	B6	B5	B4	B3	B2	B1	B0
1	Fixed to '0'	JVC remote control	AVL control OFF	PICTURE TILT ON	5 keys local keyboard	Full ATSS	Double Window Enabled	n.u. Must be set to 1 for future compatibility
0		Daewoo Remote control	AVL control ON	PICTURE TILT OFF	7 keys local keyboard	Basic ATSS	Double Window Disabled	

OPTION SETTING BY MODEL

### 3.6 NVM default setting

**The purpose of this message, when you change a virgin EEPROM, is to allow to modify the NVM DATA to desired values.**

#### **1 - Introduction :**

The NVM default values are fixed for the user, but for flexibility in service, these data are stored in NVM and can be changed when the TV set is in a special mode called "NVM EDITOR". This mode can only be accessed from "FACTORY" mode.

#### **2 - Entering into "FACTORY" mode.**

To switch the TV set into FACTORY mode, use the factory remote control, and press on "SVC" key. The factory menu will appear on the screen, showing "FACTORY", plus other relevant information like software version and date.

**WARNING :** When in "FACTORY" mode you should not press any key other than the keys described in the procedure below. Unwanted key stroke could misadjust the TV set.

#### **3 - Entering into "NVM EDITOR" mode.**

To switch the TV set into NVM EDITOR mode, use the user remote control, and press on "PICTURE/OK" key. The NVM EDITOR window will appear on the screen. This mode allows you to access all data stored in NVM. The current NVM address is given in column "ADDR." in both DECimal and HEXadecimal format. The column DATA gives the value contained at selected address in both DECimal and HEXadecimal format.

#### **4 - Navigation in "NVM EDITOR" mode.**

Use Program Up/Dwn keys to select the desired address. Use Volume Up/Dwn keys to change the data at selected address. You must press "PICTURE/OK" key to store value after modification.

The data can be adjusted between 0 and 63.

#### **5 - Exit "NVM EDITOR" mode.**

To switch the TV set back into FACTORY mode, use the user remote control, and press on "MENU" key.

The factory menu will appear on the screen, showing "FACTORY".

#### **6 - Exit "FACTORY" mode.**

To exit "FACTORY" mode, use the factory remote control, and press on "SVC" key. The factory menu will disappear from the screen.

### 3.7 TV SET ALIGNMENT

#### 3.7.1 G2 ALIGNMENT

- Tune a colour bar pattern.
- Find the "G2 – SCREEN" item in service mode.
- Adjust screen volume (on FBT) to bring the cursor to central position(Green).

#### 3.7.2 WHITE BALANCE

- Select a dark picture and adjust RED BIAS and GRN BIAS to the desired colour temperature.
- Select a bright picture and adjust RED, GRN and BLUE GAIN to the desired colour temperature.

#### 3.7.3 FOCUS

Adjust the Focus volume (on FBT) to have the best resolution on screen.

#### 3.7.4 VERTICAL GEOMETRY

Adjust V. LINEAR (linearity), S CORRECT (S. Correction), VERT SIZE (Vertical amplitude), VERT CENT (vertical centring) to compensate for vertical distortion.

#### 3.7.5 HORIZONTAL PICTURE CENTRING

Adjust HOR CEN (Horizontal centre) to have the picture in the centre of the screen.

#### 3.7.6 EAST / WEST CORRECTION

Adjust the PARABOLA, HOR WIDTH, CORNER, HOR PARAL, EW TRAPEZ, to compensate for geometrical distortion.

HOR PARAL

HOR WIDTH  
adjust for 93% overscan.

PARABOLA

CORNER B & CORNER T

EW TRAPEZ

### 3.7.7 AGC

- Make sure option bits are correct for the tuner fitted on the chassis (See above how to change option bits).
- Adjust the antenna signal level at 62 dB $\mu$ V
- Tune a colour bar pattern.
- Find the "AGC" item in service mode.
- Press the key "OK" on the remote keypad and wait until AGC level stabilise to the optimum value.
- Alternatively, use "Vol Up/Dwn" keys to adjust manually to the desired Tuner Take Over Point (TOP).

## 4 IC DESCRIPTION

### 4.1 UOC<sup>III</sup> Series

The UOC<sup>III</sup> series combines the functions of a Video Signal Processor (VSP) together with a FLASH embedded TEXT/Control/Graphics  $\mu$ -Controller (TCG  $\mu$ -Controller) and US Closed Caption decoder. In addition the following functions can be added:

- Adaptive digital (4H/2H) PAL/NTSC combfilter
- Teletext decoder with 10 page text memory
- Multi-standard stereo decoder
- BTSC stereo decoder
- Digital sound processing circuit
- Digital video processing circuit

#### 4.1.1 IC MARKING AND VERSION

Chassis	IC marking	OSD languages	ATSS countries	Text

## 4.1.2. BLOCK DIAGRAM

## 4.1.3. PINNING

QFP 128pin	Symbol	Short Description
1	P1.5/TX	Port 1.5 or UART bus
2	P1.4/RX	port 1.4 or UART bus
3	P1.2/INT2	port 1.2 or external interrupt 2
4	VSSC3	Ground
5	VDDC3	digital supply to core (1.8V)
6	P2.5/PWM4	port 2.5 or PWM4 output
7	P2.4/PWM3	port 2.4 or PWM3 output
8	VSSC/P	digital ground for m-Controller core and periphery
9	P3.3/ADC3	port 3.3 or ADC3 input
10	P3.2/ADC2	port 3.2 or ADC2 input
11	DECV1V8	decoupling 1.8 V supply
12	VDDC1	digital supply to core (+1.8 V)
13	P3.1/ADC1	port 3.1 or ADC1 input
14	P3.0/ADC0	port 3.0 or ADC0 input
15	P2.3/PWM2	port 2.3 or PWM2 output
16	P2.2/PWM1	port 2.2 or PWM1 output
17	P2.1/PWM0	port 2.1 or PWM0 output
18	P2.0/TPWM	port 2.0 or Tuning PWM output
19	VDDP(3.3V)	supply to periphery and on-chip voltage regulator (3.3 V)
20	P1.7/SDA	port 1.7 or I2C-bus data line
21	P1.6/SCL	port 1.6 or I2C-bus clock line
22	P1.3/T1	port 1.3 or Counter/Timer 1 input
23	P0.0/I2SDI1/O	port 0.0 or I2S digital input 1 or I2S digital output
24	P0.1/I2SDO1	port 0.1 or I2S digital output 1
25	P0.2/I2SDO2	port 0.2 or I2S digital output 2
26	P0.3/I2SCLK	port 0.3 or I2S clock
27	P0.4/I2SWS	port 0.4 or I2S word select
28	VSSC2	Ground
29	VDDC2	digital supply to core (1.8 V)
30	P1.1/T0	port 1.1 or Counter/Timer 0 input
31	P1.0/INT1	port 1.0 or external interrupt 1
32	INT0/P0.5	external interrupt 0 or port 0.5 (4 mA current sinking capability for direct drive of LEDs)
33	VDDadc(1.8)	supply voltage video ADC
34	VSSadc	ground for on-chip temperature sensor
35	VDDA2(3.3)	supply voltage SDAC (3.3 V)
36	VDDA(1.8)	analogue supply for audio ADCs (1.8 V)
37	GNDA	Ground
38	VREFAD	reference voltage for audio ADCs (3.3/2 V)
39	VREFAD_POS	positive reference voltage (3.3 V)
40	VREFAD_NEG	negative reference voltage (0 V)
41	VDDA1	analog supply for TCG m-Controller and digital supply for TV-processor (+3.3 V)
42	BO	Blue output

43	GO	Green output
44	RO	Red output
45	BLKIN	black current input
46	BCLIN	beam current limiter input
47	VP3	3rd supply for TV processor
48	GND3	ground 3 for TV-processor
49	B/PBIN3	3rd B input / PB input
50	G/YIN3	3rd G input / Y input
51	R/PRIN3	3rd R input / PR input
52	INSSW3	3rd RGB / YPBPR insertion input
53	VOUT(SWO1)	V-output for YUV interface (general purpose switch output)
54	UOUT(INSSW2)	U-output for YUV interface (2nd RGB / YPBPR insertion input)
55	YOUT	Y-output (for YUV interface)
56	YSYNC	Y-input for sync separator
57	YIN (G/YIN2/CVBS-Yx)	Y-input for YUV interface (2nd G input / Y input or CVBS/YX input))
58	UIN (B/PBIN2)	U-input for YUV interface (2nd B input / PB input)
59	VIN (R/PRIN2/CX)	V-input for YUV interface (2nd R input / PR input or CX input)
60	VDDcomb	supply voltage for comb filter (5 V)
61	VSScomb	ground connection for comb filter
62	HOUT	horizontal output
63	FBISO/CSY	flyback input/sandcastle output or composite H/V timing output
64	SVM	scan velocity modulation output
65	CVBSO/PIP	CVBS / PIP output
66	AUDOUTHPR	audio output for headphone channel (right signal)
67	AUDOUTHPL	audio output for headphone channel (left signal)
68	AUDOUTLSR	audio output for audio power amplifier (right signal)
69	AUDOUTLSL	audio output for audio power amplifier (left signal)
70	C2/C3	chroma-2/3 input
71	CVBS3/Y3	CVBS3/Y3 input
72	AUDIOIN3R	audio 3 input (right signal)
73	AUDIOIN3L	audio 3 input (left signal)
74	CVBS2/Y2	CVBS2/Y2 input
75	AUDIOIN2R	audio 2 input (right signal)
76	AUDIOIN2L	audio 2 input (left signal)
77	C4	chroma-4 input
78	CVBS4/Y4	CVBS4/Y4 input
79	AUDIOIN4R	audio-4 input (right signal)
80	AUDIOIN4L	audio-4 input (left signal)
81	IFVO/SVO/CVBSI (2)	IF video output / selected CVBS output / CVBS input
82	VP2	2nd supply voltage TV processor (+5 V)
83	AGC2SIF	AGC capacitor second sound IF
84	VCC8V	8 Volt supply for audio switches
85	DVBO/FMRO (2)	Digital Video Broadcast output / FM radio output
86	DVBO/IFVO/FMRO (2)	Digital Video Broadcast output / IF video output / FM radio output

87	SIFAGC/DVBAGC (2)	AGC sound IF / internal-external AGC for DVB applications
88	PLLIF	IF-PLL loop filter
89	GND2	ground 2 for TV processor
90	QSSO/AMOUT/AUDEE M (2)	QSS intercarrier output / AM output / deemphasis (front-end audio out)
91	DECSDEM	decoupling sound demodulator
92	AUDOUTSR	audio output for SCART/CINCH (right signal)
93	AUDOUTSL	audio output for SCART/CINCH (left signal)
94	AUDIOIN5R	audio-5 input (right signal)
95	AUDIOIN5L	audio-5 input (left signal)
96	AVL/SWO/SSIF/ REFO/REFIN (2)	Automatic Volume Levelling / switch output / sound IF input / subcarrier reference output / external reference signal input for I signal mixer for DVB operation
97	EHTO	EHT/overvoltage protection input
98	AGCOUT	tuner AGC output
99	SIFIN2/DVBIN2 (2)	SIF input 2 / DVB input 2
100	SIFIN1/DVBIN1 (2)	SIF input 1 / DVB input 1
101	GNDIF	ground connection for IF amplifier
102	IREF	reference current input
103	VSC	vertical sawtooth capacitor
104	VIFIN2	IF input 2
105	VIFIN1	IF input 1
106	VDRA	vertical drive A output
107	VDRB	vertical drive B output
108	EWD/AVL (1)	East-West drive output or AVL capacitor
109	DECBG	bandgap decoupling
110	SECPLL	SECAM PLL decoupling
111	GND1	ground 1 for TV-processor
112	PH1LF	phase-1 filter
113	PH2LF	phase-2 filter
114	VP1	1st supply voltage TV-processor (+5 V)
115	DECDIG	decoupling digital supply
116	VGUARD/SWIO	V-guard input / I/O switch (e.g. 4 mA current sinking capability for direct drive of LEDs)
117	VSSA1	Ground
118	XTALOUT	crystal oscillator output
119	XTALIN	crystal oscillator input
120	VREF_POS_HPR	positive reference voltage SDAC (3.3 V)
121	VREF_NEG_HPL+HPR	negative reference voltage SDAC (0 V)
122	VREF_POS_LSR+HPR	positive reference voltage SDAC (3.3 V)
123	VREF_NEG_LSL+HPL	negative reference voltage SDAC (0 V)
124	VREF_POS_LSL	positive reference voltage SDAC (3.3 V)
125	VDDA3(3.3V)	supply (3.3 V)
126	VDDC4	digital supply to SDACs (1.8V)
127	VSSC4	Ground
128	VSSP2	Ground

#### 4.1.4 FEATURES

##### **Analogue Video Processing (all versions)**

- Multi-standard vision IF circuit with alignment-free PLL demodulator
- Internal (switchable) time-constant for the IF-AGC circuit
- Switchable group delay correction and sound trap (with switchable centre frequency) for the demodulated CVBS signal
- DVB/VSF IF circuit for preprocessing of digital TV signals.
- Video switch with 3 external CVBS inputs and a CVBS output. All CVBS inputs can be used as Y-input for Y/C signals. However, only 2 Y/C sources can be selected because the circuit has 2 chroma inputs. It is possible to add an additional CVBS(Y)/C input (CVBS/YX and CX) when the YUV interface and the RGB/YPRPB input are not needed.
- Automatic Y/C signal detector
- Adaptive digital (4H/2H) PAL/NTSC comb filter for optimum separation of the luminance and the chrominance signal.
- Integrated luminance delay line with adjustable delay time
- Picture improvement features with peaking (with switchable centre frequency, depeaking, variable positive/negative peak ratio, variable pre-/overshoot ratio and video dependent coring), dynamic skin tone control, gamma control and blue- and black stretching. All features are available for CVBS, Y/C and RGB/YPBPR signals.
- Switchable DC transfer ratio for the luminance signal
- Only one reference (24.576 MHz) crystal required for the TCG m-Controller, digital sound processor, Teletext and the colour decoder
- Multi-standard colour decoder with automatic search system and various “forced mode” possibilities
- Internal base-band delay line
- Indication of the Signal-to-Noise ratio of the incoming CVBS signal
- Linear RGB/YPBPR input with fast insertion.
- YUV interface. When this feature is not required some pins can be used as additional RGB/YPBPR input. It is also possible to use these pins for additional CVBS (or Y/C) input (CVBS/YX and CX).
- Tint control for external RGB/YPBPR signals
- Scan Velocity Modulation output. The SVM circuit is active for all the incoming CVBS, Y/C and RGB/YPBPR signals. The SVM function can also be used during the display of teletext pages.
- RGB control circuit with ‘Continuous Cathode Calibration’, white point and black level off-set adjustment so that the colour temperature of the dark and the light parts of the screen can be chosen independently.
- Contrast reduction possibility during mixed-mode of OSD and Text signals
- Adjustable ‘wide blanking’ of the RGB outputs
- Horizontal synchronization with two control loops and alignment-free horizontal oscillator
- Vertical count-down circuit
- Vertical driver optimized for DC-coupled vertical output stages
- Horizontal and vertical geometry processing with horizontal parallelogram and bow correction and horizontal and vertical zoom
- Low-power start-up of the horizontal drive circuit

##### **Analogue video processing (stereo versions)**

- The low-pass filtered ‘mixed down’ I signal is available via a single ended or balanced output stage.

##### **Analogue video processing (mono versions)**

- The low-pass filtered ‘mixed down’ I signal is available via a single ended output stage

##### **Digital Video Processing (some versions)**

- Double Window mode applications. It is possible to display a video and a text window or 2 text

windows in parallel.

- Linear and non-linear horizontal scaling of the video signal to be displayed.

### **Sound Demodulation (all versions)**

- Separate SIF (Sound IF) input for single reference QSS (Quasi Split Sound) demodulation.
- AM demodulator without extra reference circuit
- The mono intercarrier sound circuit has a selective FM-PLL demodulator which can be switched to the different FM sound frequencies (4.5/5.5/6.0/6.5 MHz). The quality of this system is such that the external band-pass filters can be omitted. In the stereo versions of UOCIII the use of this demodulator is optional for special applications. Normally the FM demodulators of the stereo demodulator/decoder part are used (see below).
- The FM-PLL demodulator can be set to centre frequencies of 4.72/5.74 MHz so that a second sound channel can be demodulated. In such an application it is necessary that an external bandpass filter is inserted.
- The vision IF and mono intercarrier sound circuit can be used for the demodulation of FM radio signals. With an external FM tuner also signals with an IF frequency of 10.7 MHz can be demodulated.
- Switch to select between 2nd SIF from QSS demodulation or external FM (SSIF)

### **Audio Interfaces and switching (stereo versions with Audio DSP)**

- Audio switch circuit with 4 stereo inputs, a stereo output for SCART/CINCH, 1 stereo output for HEADPHONE. The headphone channel has an analogue volume control circuit for the L and R channel. Finally 1 stereo SPEAKER output with digital controls.
- AVL (Automatic Volume Levelling) circuit for the headphone channel.
- Digital input crossbar switch for all digital signal sources and destinations
- Digital output crossbar for exchange of channel processing functionality
- Digital audio input interface (stereo I2S input interface)
- Digital audio output interface (stereo I2S output interface)

### **Audio interfaces and switching (AV stereo versions without Audio DSP)**

- Audio switch circuit with 4 stereo inputs, a stereo output for SCART/CINCH and a stereo SPEAKER output with analogue volume control.
- Analogue mono AVL circuit at left audio channel

### **Audio interfaces and switching (mono versions)**

- Audio switch circuit with 4 external audio (mono) inputs and a volume controlled output
- AVL circuit

### **Stereo Demodulator and Decoder (full stereo versions)**

- Demodulator and Decoder Easy Programming (DDEP)
- Auto standard detection (ASD)
- Static Standard Selection (SSS)
- DQPSK demodulation for different standards, simultaneously with 1-channel FM demodulation
- NICAM decoding (B/G, I, D/K and L standard)
- Two-carrier multistandard FM demodulation (B/G, D/K and M standard)
- Decoding for three analog multi-channel systems (A2, A2+ and A2\*) and satellite sound
- Adaptive de-emphasis for satellite FM
- Optional AM demodulation for system L, simultaneously with NICAM
- Identification A2 systems (B/G, D/K and M standard) with different identification time constants
- FM pilot carrier present detector
- Monitor selection for FM/AM DC values and signals, with peak and quasi peak detection option
- BTSC MPX decoder
- SAP decoder
- dbx®noise reduction (4)
- Japan (EIAJ) decoder
- FM radio decoder
- Soft-mute for DEMDEC outputs DEC, MONO and SAP

- FM overmodulation adaptation option to avoid clipping and distortion

#### **Audio Multi Channel Decoder (stereo versions with Audio DSP)**

- Dolby®Pro Logic®(DPL) (1)
- Five channel processing for Main Left and Right, Subwoofer, Centre and Surround. To exploit this feature an external DAC is required.

#### **Volume and tone control for loudspeakers (stereo versions with Audio DSP)**

- Automatic Volume Level (AVL) control
- Smooth volume control
- Master volume control
- Soft-mute
- Loudness
- Bass, Treble
- Dynamic Bass Boost (DBB) (2)
- Dynamic Virtual Bass (DVB) (3)
- BBE®Sound processing (4)
- Graphic equalizer
- Processed or non processed subwoofer
- Programmable beeper

#### **Reflection and delay for loudspeaker channels (stereo versions with Audio DSP)**

- Dolby®Pro Logic®Delay (1)
- Pseudo hall/matrix function

#### **Psycho acoustic spatial algorithms, downmix and split in loudspeaker channels (stereo versions with Audio DSP)**

- Extended Pseudo Stereo (EPS) (5)
- Extended Spatial Stereo (ESS) (6)
- Virtual Dolby®Surround (VDS 422,423) (1)
- SRS 3D and SRS TruSurround®(4)

#### **RDS/RBDS**

- Demodulation of the European Radio Data system (RDS) or the USA Radio Broadcast Data System (RBDS) signal
- RDS and RBDS block detection
- Error detection and correction
- Fast block synchronisation
- Synchronisation control (flywheel)
- Mode control for RDS/RBDS processing
- Different RDS/RBDS block information output modes

#### **m-Controller**

- 80C51 m-controller core standard instruction set and timing
- 0.4883 ms machine cycle
- maximum of 256k x 8-bit flash programmable ROM
- maximum of 8k x 8-bit Auxiliary RAM
- 12-level Interrupt controller for individual enable/disable with two level priority
- Two 16-bit Timer/Counter registers
- One 24-bit Timer (16-bit timer with 8-bit Pre-scaler)
- WatchDog timer
- Auxiliary RAM page pointer
- 16-bit Data pointer
- Stand-by, Idle and Power Down modes
- 24 general I/O
- 14 bits PWM for Voltage Synthesis Tuning
- 8-bit A/D converter with 4 multiplexed inputs

- 5 PWM (6-bits) outputs for analogue control functions
- Remote Control Pre-processor (RCP)
- Universal Asynchronous Receiver Transmitter (UART)

#### **Data Capture**

- Text memory up to 10 pages
- Inventory of transmitted Teletext pages stored in the Transmitted Page Table (TPT) and Subtitle Page Table (SPT)
- Data Capture for US Closed Caption
- Data Capture for 525/625 line WST, VPS (PDC system A) and Wide Screen Signalling (WSS) bit decoding
- Automatic selection between 525 WST/625 WST
- Automatic selection between 625 WST/VPS on line 16 of VBI
- Real-time capture and decoding for WST Teletext in Hardware, to enable optimized m-processor throughput
- Automatic detection of FASTEXT transmission
- Real-time packet 26 engine in Hardware for processing accented, G2 and G3 characters
- Signal quality detector for video and WST/VPS data types
- Comprehensive teletext language coverage
- Vertical Blanking Interval (VBI) data capture of WST data

#### **Display**

- Teletext and Enhanced OSD modes
- Features of level 1.5 WST and US Close Caption
- 50Hz/60Hz display timing modes
- Two page operation for 16:9 screens
- Serial and Parallel Display Attributes
- Single/Double/Quadruple Width and Height for characters
- Smoothing capability of both Double Size, Double Width & Double Height characters
- Scrolling of display region
- Variable flash rate controlled by software
- Soft colours using CLUT with 4096 colour palette
- Globally selectable scan lines per row (9/10/13/16/) and character matrix [12x9, 12x10, 12x13, 12x16, 16x18, (VxH)]
- Fringing (Shadow) selectable from N-S-E-W direction
- Fringe colour selectable
- Contrast reduction of defined area
- Cursor
- Special Graphics Characters with two planes, allowing four colours per character
- 64 software redefinable On-Screen display characters
- 4 WST Character sets (G0/G2) in single device (e.g. Latin, Cyrillic, Greek, Arabic)
- G1 Mosaic graphics, Limited G3 Line drawing characters
- WST Character sets and Closed Caption Character set in single device
- SVM for Text

## **4.2 TDA8946J STEREO AUDIO AMPLIFIER**

The TDA 8946J is a dual-channel audio power amplifier with an output power of 2 x 15 W at an 8  $\Omega$  load and a 18 V supply. The circuit contains two Bridges Tied Load (BTL) amplifiers with an

all-NPN output stage and standby/mute logic. The TDA8946J comes in a 17-pin DIL-bent-SIL(DBS) power package.

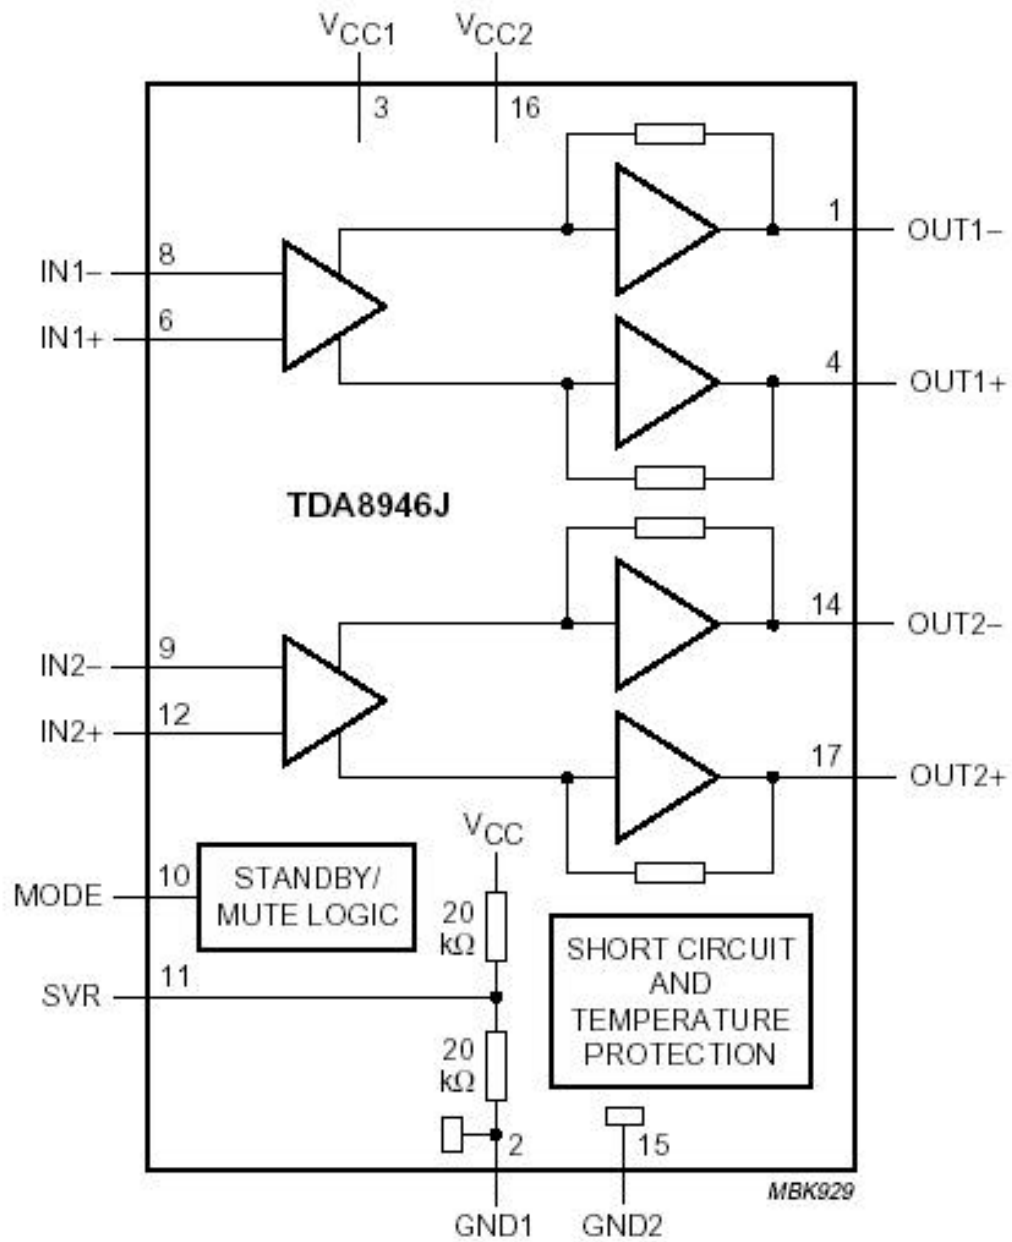

#### 4.2.1 FEATURES

- Few external components
- Fixed gain
- Standby and mute mode
- No on/off switching plops
- Low standby current
- High supply voltage ripple rejection
- Outputs short-circuit protected to ground, supply and across the load
- Thermally protected

Pin description

Pin	Symbol	Description
1	OUT1-	negative loudspeaker terminal 1
2	GND1	ground channel 1
3	Vcc1	supply voltage channel 1
4	OUT1+	positive loudspeaker terminal 1

### 4.3 TDA8358J VERTICAL AMPLIFIER

The TDA8358J are power circuit for use in 90° and 110° colour deflection systems for field frequencies of 25 to 200Hz field frequencies, and for 4:3 and 16/9 picture tubes. The IC contains a vertical deflection output circuit, operating as a high efficiency class G system. The full bridge output circuit allows DC coupling of the deflection coil in combination with single positive supply voltages.

The east-west output stage is able to supply the sink current for a diode modulator circuit.

The IC is constructed in a Low Voltage DMOS(LVDMOS) process that combines bipolar, CMOS and DMOS devices. DMOS transistors are used in the output stage because of the absence of second breakdown.

#### 4.3.1 TDA8358J

Features :

- Few external components
- Highly efficient fully DC-coupled vertical bridge output circuit
- Vertical flyback switch with short rise and fall times
- Built-in guard circuit
- Thermal protection circuit
- Improved EMC performance due to differential inputs
- East-west output stage

## Pinning

Pin	Symbol	Description
1	INA	Positive vertical input
2	INB	Negative vertical input
3	V <sub>P</sub>	Supply voltage
4	OUTB	Vertical output voltage B
5	INEW	East-west input voltage
6	VGND	Vertical ground
7	EWGND	East-west ground
8	OUTEW	East-west output voltage
9	V <sub>FB</sub>	Flyback supply voltage
10	OUTA	Vertical output voltage A
11	GUARD	Guard output voltage
12	FEEDB	Input measuring resistor
13	COMP	Input compensation current

Block diagram TDA8358J

#### 4.4 TDA6107AJF

The TDA6107AJF includes three video output amplifiers and is intended to drive the three cathodes of a colour CRT directly. The device is contained in a plastic DIL-bent-SIL 9-pin medium power(DBS9MPF) package, and uses high-voltage DMOS technology.

To obtain maximum performance, the amplifier should be used with black-current control.

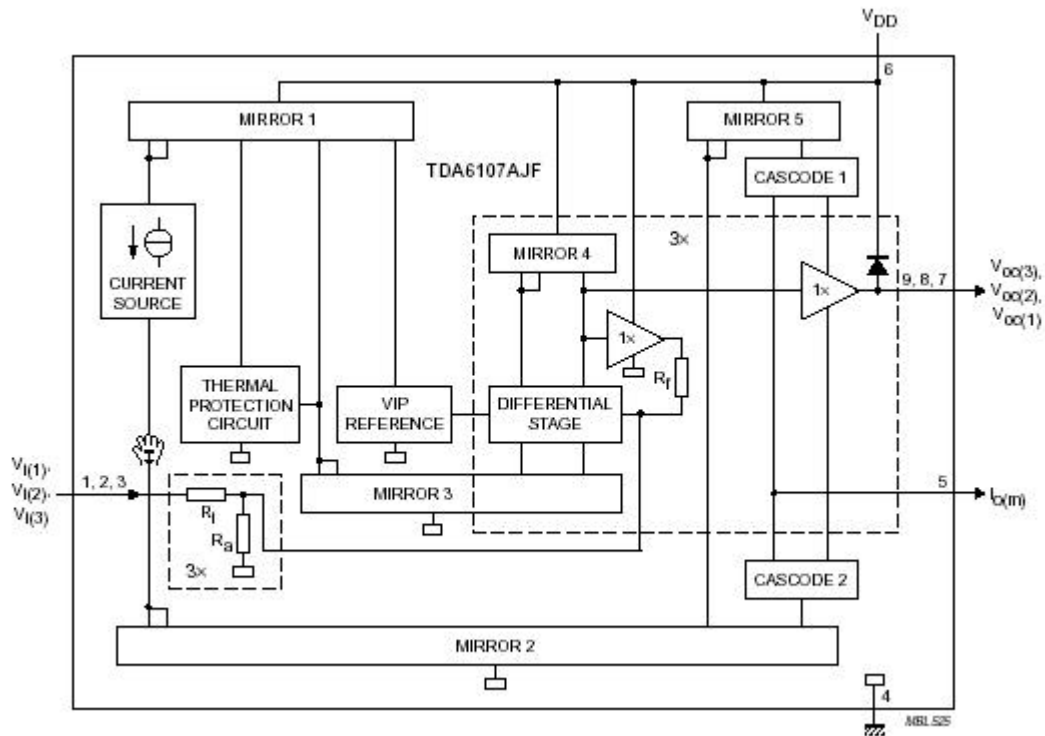

##### 4.4.1 Features

- Typical bandwidth of 5.5 MHz for an output signal of 60 Vpp
- High slew rate of 900V/ $\mu$ s
- No external components required
- Very simple application
- Single supply voltage of 200V
- Internal reference voltage of 2.5 V
- Fixed gain of 81.
- Black-current stabilisation (BCS) circuit with voltage window from 1.8 to 6 V and current window from 100uA to -10mA
- Thermal protection
- Internal protection against positive flashover discharges appearing on the CRT

##### 4.4.2 Pin description

#### 4.5 24WC16 - 16 KB EEPROM

##### Features :

- 16 Kbit serial I2C bus EEPROM
- 400KHz I2C Bus Compatible
- supply voltage : 1.8 V to 6.0 V
- Low Power CMOS Technology
- 1 Million Erase/Write cycles (minimum)
- 100 year data retention (minimum)

##### Pin description

Pin No.	Name	Description
1, 2, 3	A0, A1, A2	Device address – not used
5	SDA	Serial Data/Address Input/Output
6	SCL	Serial clock
7	WP	Write control
8	Vcc	Supply voltage
4	Vss	Ground

The memory device is compatible with the I2C memory standard. This is a two wire serial interface that uses a bi-directional data bus and serial clock. The memory carries a built-in 4-bit unique device type identifier code (1010) in accordance with the I2C bus definition.

##### Serial Clock (SCL)

The SCL input is used to strobe all data in and out of the memory.

##### Serial Data (SDA)

The SDA pin is bi-directional, and is used to transfer data in or out of the memory.

#### 4.6 STR - F6653

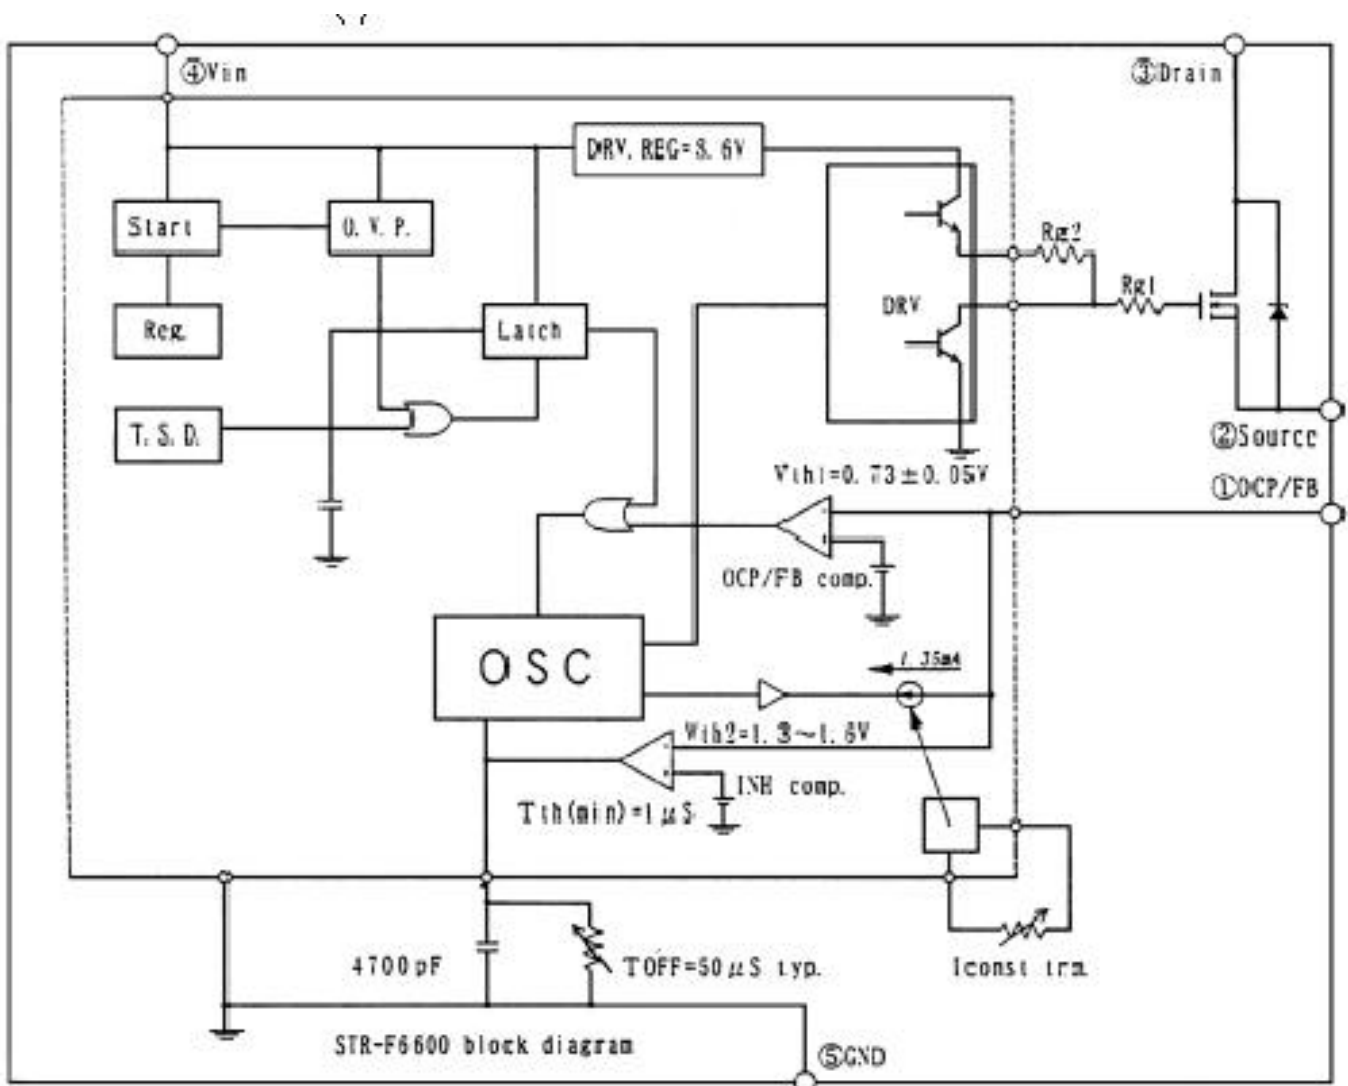

#### 4.6.1 GENERAL DESCRIPTION

The STR-F6653 is an hybrid IC with a build-in MOSFET and control IC, designed for flyback converter type switch mode power supply applications.

### 4.6.2 FEATURES

- Small SIP fully isolated moulded 5 pins package
- Many protection functions :
  - ❖ Pulse-by-pulse overcurrent protection (OCP)
  - ❖ Overvoltage protection with latch mode (OVP)
  - ❖ Thermal protection with latch mode (TSD)

## 5 CIRCUIT DESCRIPTION

### 5.1 BLOCK DIAGRAM

## 5.2 FUNCTIONAL DESCRIPTION OF VIDEO PROCESSOR

### 5.2.1 Vision IF amplifier

The vision IF amplifier can demodulate signals with positive and negative modulation. The PLL demodulator is completely alignment-free.

The VCO of the PLL circuit is internal and the frequency is fixed to the required value by using the clock frequency of the TCG u-Controller as a reference. The setting of the various frequencies (e.g. 38, 38.9, 45.75 and 58.75MHz) can be made via the control bits IFA-IFC in subaddress 2FH. Because of the internal VCO the IF circuit has a high immunity to EMC interferences.

The output of the AFC detector can be read from output byte 04H and has a resolution of 7bit(25kHz per step). By means of this information a fast tuning algorithm can be designed.

The IC contains a group delay correction circuit which can be switched between the BG and a uncompensated group delay response characteristic. This has the advantage that in multi-standard receivers no compromise has to be made for the choice of the SAW filter. This group delay correction is realised for the demodulated CVBS output signal. The IC contains in addition a sound trap circuit with a switchable centre frequency.

### 5.2.2 QSS sound circuit

The sound IF amplifier is similar to the vision IF amplifier and has an external AGC decoupling capacitor.

The single reference QSS mixer is realised by a multiplier. In this multiplier the SIF signal is converted to the intercarrier frequency by mixing it with the regenerated picture carrier from the VCO. The mixer output signal is supplied to the output via a high-pass filter for attenuation of the residual video signals. With this system a high performance hi-fi stereo sound processing can be achieved.

The AM sound demodulator is realised by a multiplier. The modulated sound IF signal is multiplied in phase with the limited SIF signal. The demodulator output signal is supplied to the output via a low-pass filter for attenuation of the carrier harmonics.

Switching between the QSS output and AM output is made by means of the AM bit in subaddress 33H.

### 5.2.3 FM demodulator

The FM demodulator is realised as a narrow-band PLL with internal loop filter, which provides the necessary selectivity without using an external band-pass filter. To obtain a good selectivity a linear phase detector and a constant input signal amplitude are required. For this reason the intercarrier signal is internally supplied to the demodulator via a gain controlled amplifier and AGC circuit. To improve the selectivity an internal bandpass filter is connected in front of the PLL circuit.

The nominal frequency of the demodulator is tuned to the required frequency (4.5/5.5/6.0/6.5 MHz) by means of a calibration circuit which uses the clock frequency of the TCG(1)-Controller as a reference. It is also possible to frequencies of 4.72 and 5.74Mhz so that a second sound channel can be demodulated. In the latter application an external bandpass filter has to be

applied to obtain sufficient selectivity (the sound input can be activated by means of the setting of CMB2-CMB0 bits in subaddress 4AH). The setting to the wanted frequency is realised by means of the control bits FMA, FMB and FMC in the control bit 33H.

From the output status bytes it can be read whether the PLL frequency is inside or outside the window and whether the PLL is in lock or not. With this information it is possible to make an automatic search system for the incoming sound frequency. This can be realised by means of a software loop which switches the demodulator to the various frequencies and then select the frequency on which a lock condition has been found.

The amplitude deemphasis output signal changed with 6dB by means of the AGN bit. In this way output signal differences between the 4.5 MHz standard (frequency deviation 25 kHz) and the other standards (frequency deviation 50 kHz) can be compensated.

## **5.2.4 Audio input selector and volume control**

### **5.2.4.1 STEREO AND AV STEREO VERSIONS**

The audio input selector circuit has 4 external stereo inputs, a stereo output for SCART/CINCH and stereo outputs for headphone and audio power amplifiers. The selection is made with the bits SAS2/0, SO2/0 and HPO2/0. AV stereo versions without Audio DSP have no headphone output. The input signal selection for the volume controlled audio output is realised by the HPO2/0 bits.

The gain from an external audio input to each of the (non-controlled) analog output is 0 or +6dB (controlled by the DSG bit). A supply voltage of 5V allows input and output amplitude of 1VRMS full scale, as required to comply with the SCART specification, the audio supply voltage must be 8V. In that case the gain of the audio amplifier must be doubled. This can be realised with the DSG bit in subaddress 32H.

The circuit contains an analogue stereo volume control circuit with a control range of about 70dB. This volume control circuit is used for the headphone channel (stereo versions with Audio DSP) or for the main channel (AV stereo versions without Audio DSP). The analogue control circuit also contains an Automatic Volume Levelling (AVL) function. When this function is activated it stabilises the audio output signal to a certain level so that big fluctuations of the output power are prevented.

### **5.2.4.2 MONO VERSIONS**

The audio input selector circuit has 4 inputs for mono signals. The selection is made with the HPO2/0 bits.

The circuit contains an analogue volume control circuit with a control range of about 70dB and an AVL circuit.

## **5.2.5 CVBS and Y/C input signal selection**

### **5.2.5.1 ALL VERSIONS**

The ICs have 3 inputs for external CVBS signals. All CVBS inputs can be used as Y input for the insertion of Y/C signals. However, the CVBS(Y)2 input has to be combined with the C3 input. It is possible to add an extra CVBS(Y/C) input via the pins which are intended to be used for YUV interface (or RGB/YPrPb input). The selection of this additional CVBS(Y/C) input is made via the YC bit.

The function of the IFVO/SVO/CVBSI pin is determined by the SVO1/SVO0 bits. When used as output a selection can be made between the IF video output signal or the selected CVBS signal (monitor out). This pin can also be used as additional CVBS input. This signal is inserted in front of the group delay / sound trap circuit. It is also possible to use the group delay and sound trap circuit for the CVBS2 signal (via the CV2 bit).

For the CVBS(Y/C) inputs the circuit can detect whether a CVBS or Y/C signal is present on the input. The result can be read from the status register (YCD bit in subaddress 03H) and this information can be used to put the input switch in the right position (by means of the INA-IND bits in subaddress 38H). The Y/C detector is only active for the CVBS(Y)3/C3, CVBS(Y)4/C4 and CVBS(Y)x/Cx inputs. It is not active for the CVBS(Y)2/C3 input.

The video ident circuit can be connected to all video input signals. This ident circuit is independent of the synchronisation and can be used to switch the synchronisation and can be used to switch the presence of a video signal (via the VID bit). In this way a very stable OSD can be realised. The result of the video ident circuit can be read from the output bit SID (subaddress 00).

### 5.2.6 Synchronisation circuit

The IC contains separator circuits for the horizontal and vertical sync pulses. To obtain an accurate timing of the displayed picture the input signal of the sync separator is not derived from the various CVBS/Y or RGB/YPrPb inputs but from the YOUT pin. For this reason the YOUT pin must be capacitively coupled to the YSYNC pin. The delay between the various inputs and the YOUT signal can have rather large differences (e.g. comb filter active or not). By choosing the YOUT signal as input signal for the sync separator these delays have no effect on the picture position. Only for RGB signals without sync on green the input of the sync separator has to be connected to one of the CVBS inputs. This selection is made by means of the SYS bit.

The horizontal drive signal is obtained from an internal VCO which is running at a frequency of 25 MHz. This oscillator is stabilised to this frequency by using the clock signal coming from the reference oscillator of the TCG -Controller.

To obtain a stable On-Screen-Display (OSD) under all conditions it is important that the first control loop is switched off or set to low gain when no signal is available at the input. The input signal condition is detected by the video identification circuit. The video identification circuit can automatically switch first control loop to a low gain when no input signal is available. This mode is obtained when the VID bit is set to "0". When the VID bit is "1" the mode of the first control loop can be switched by means of the FOA/FOB or POC bits.

For a good performance during normal TV reception (display of the front-end signal) various connections are active between the vision IF amplifier and the synchronisation circuit (e.g. gating pulses for the AGC detector and noise gating of the sync separator). These connections are not allowed when external video signals are displayed. The switching of these connections can be coupled to the input signal selection bits (INA-IND). This mode is obtained when the VDXEN bit is "0". Due to the input signal selector configuration it is possible that the internal CVBS signal is

available on one of the other CVBS inputs. In this condition the connections between the vision IF amplifier and the synchronisation circuit can be switched on and off by means of the VDX bit. The VDXEN bit must be set to "1" for this mode.

The vertical synchronisation is realised by means of a divider circuit.

### 5.2.7 Horizontal and vertical drive

The horizontal drive is switched on and off via the soft start/stop procedure. The soft start function is realised by means of variation of the TON of the horizontal drive pulses. During the soft-stop period the horizontal output frequency is doubled resulting in a reduction of the EHT so that the picture tube capacitance can easily be discharged. In addition the horizontal drive circuit has a 'low-power start-up' function.

The vertical ramp generator needs an external resistor and capacitor. For the vertical drive a differential output current is available. The outputs must be DC coupled to the vertical output stage.

The IC has the following geometry control functions:

- Vertical amplitude
- Vertical slope
- S-correction
- Vertical shift
- Vertical zoom
- Vertical scroll
- Vertical linearity correction. When required the linearity setting for the upper and lower part of the screen can have a different setting.
- Horizontal shift
- EW width
- EW parabola width
- EW upper and lower corner parabola correction
- EW trapezium correction
- Horizontal parallelogram and bow correction.

When the East-West geometry function is not required (e.g. for 90 picture tubes) the EW output pin can be used for the connection of the AVL capacitor. This function is chosen by means of the AVLE bit.

### 5.2.8 Chroma, luminance and feature processing

Some versions contain a 4H/2H(2D) adaptive PAL/NTSC comb filter. The comb filter is automatically activated when standard CVBS signals are received. A signal is considered as "standard signal" when a PAL or NTSC signal is identified and when the vertical divider is in the modes 'standard narrow window' or 'standard TV norm'. For non-standard signals and for SECAM signals the comb filter is bypassed and the signal is filtered by means of bandpass and trap filters.

The chroma band-pass and trap circuits (including the SECAM cloche filter) are realised by means of internal filters and are tuned to the right frequency by comparing the tuning frequency with the reference frequency of the colour decoder.

The circuit contains the following picture improvement features:

- Peaking control circuit. The peaking function can be activated for all incoming CVBS, Y/C and RGB/YPrPb signals. Various parameters of the peaking circuit can be adapted by means of the I2C-bus. The main parameters are:
  - Peaking centre frequency (via the PF1/PF0 bits in subaddress 19H).
  - Ratio of positive and negative peaks (via the RPO1/RPO0 bits in subaddress 47H). The peaks in the direction “white” are the positive peaks.
  - Ratio of pre- and aftershoots (via the RPA1/RPA0 bits in subaddress 47H).
- Video dependent coring in the peaking circuit. The coring can be activated only in the low-light parts of the screen. This effectively reduces noise while having maximum peaking in the bright parts of the picture.
- Black stretch. This function corrects the black level for incoming signals which have a difference between the black level and the blanking level. The amount of stretching (A-A in Fig. 72) and the minimum required back ground to activate the stretching can be set by means of the I2C-bus (BSD/AAS in subaddress 45H).
- Gamma control. When this function is active the transfer characteristic of the luminance amplifier is made non-linear. The control curve can be adapted by means of I2C-bus settings (see Fig. 74). It is possible to make the gamma control function dependent on the picture content (Average Picture Level, APL). The effect is illustrated in Fig. 75. Previously this function was mentioned under the name “white stretch function”.
- Blue-stretch. This circuit is intended to shift colour near ‘white’ with sufficient contrast values towards more blue to obtain a brighter impression of the picture.
- Dynamic skin tone (flesh) control. This function is realised in the YUV domain by detecting the colours near to the skin tone.
- Scan-Velocity modulation output. Also the SVM function can be activated for all incoming CVBS, Y/C and RGB/YPrPb signals. The delay between the RGB output signals and the SVM output signal can be adjusted (by means of the SVM2-SVM0 bits in subaddress 48H) so that an optimum picture performance can be obtained. Furthermore a coring function can be activated. It is possible to generate Scan Velocity Modulation drive signals during the display of ‘full screen’ teletext (not in mixed mode). Another feature is that the SVM output signal can be made dependent on the horizontal position on the screen (parabola on the SVM output).

### 5.2.9 Colour decoder

The ICs decode PAL, NTSC and SECAM signals. The PAL/NTSC decoder does not need external reference crystals but has an internal clock generator which is stabilised to the required frequency by using the clock signal from the reference oscillator of the TCG u -Controller.

Under bad-signal conditions (e.g. VCR-playback n feature mode), it may occur that the colour killer is activated although the colour PLL is still in lock. When this killing action is not wanted it is possible to overrule the colour killer by forcing the colour decoder to the required standard and to activate the FCO-bit (Forced Colour On) in subaddress 3CH. The sensitivity of the colour decoder for PAL and NTSC can be increased by means of the setting of the CHSE1/CHSE0 bits in subaddress 3CH.

The Automatic Colour Limiting (ACL) circuit (switchable via the ACL bit in subaddress 3BH) prevents that oversaturation occurs when signals with a high chroma-to-burst ratio are received. The ACL circuit is designed such that it only reduces the chroma signal and not the burst signal. This has the advantage that the colour sensitivity is not affected by this function.

The SECAM decoder contains an auto-calibrating PLL demodulator which has two references, viz: the divided reference frequency (obtained from the Controller) which is used to tune the PLL to the desired free-running frequency and the bandgap reference to obtain the correct absolute value of the output signal. The VCO of the PLL is calibrated during each vertical blanking period, when the IC is in search or SECAM mode. The frequency offset of the B-Y demodulator can be reduced by means of the SBO1/SBO0 bits in subaddress 3CH.

The base-band delay line is integrated. In devices without CVBS comb filter this delay line is also active during NTSC to obtain a good suppression of cross colour effects. The demodulated colour difference signals are internally supplied to the delay line. The baseband comb filter can be switched off by means of the BPS bit (subaddress 3CH).

The subcarrier output is combined with a 3-level output switch (0 V, 2.1 V and 4.5 V). The output level and the availability of the subcarrier signal is controlled by the CMB2-CMB0 bits.

### 5.2.10 RGB output circuit

In the RGB control circuit the signal is controlled on contrast, brightness and saturation. The IC has a YUV interface so that additional picture improvement ICs can be applied. To compensate signal delays in the external YUV path the clamp pulse in the control circuit can be shifted by means of the CLD bit in subaddress 44H. When the YUV interface is not required some of the pins can be used for the insertion of RGB/YPrPb signals or as additional CVBS(Y)/C input. When the YUV interface is not used one of the pins (VOU1) is transferred to general purpose output switch (SWO1). The IC has also a YUV interface to the digital. Via this loop digital features like "double window" are added.

A tint control is available for the base-band U/V signals. For this reason this tint control can be activated for all colour standards. The signals for OSD and text are internally supplied to the control circuit. The output signal has an amplitude of about 1.2V black-to-white at nominal input signals and nominal settings of the various controls.

To obtain an accurate biasing of the picture tube the 'Continuous Cathode Calibration' system has been included in these ICs. The system is slightly adapted compared with the previous circuits. In the new configuration the cut-off level of the picture tube is controlled with a continuous loop whereas the correction of the amplitude of the output signals is realised by means of a digital loop. As a consequence the current measurement can be controlled from the Processor. The value of the "highcurrent" in the CCC loop can be chosen via the SLG0 and SLG1 bits (subaddresses 42H and 46H). The gain control in the 3 RGB channels is realised by means of 7-bit DACs. The total gain control range is 6 dB. The change in amplitude at the cathodes of the picture tube for one LSB is about 1.1 Vp-p. The setting of the control DAC is determined by the following registers:

- The white point setting of the R, G and B channel in subaddress 20H to 22H. This register has a resolution of 6 bits and the control range in output signal amplitude is  $\pm 3$  dB.
- The cathode drive setting (CL3-CL0 in subaddress 42H). This setting is valid for all channels, there resolution is 4 bits and the control range is  $\pm 3$  dB.
- The gain setting of the R, G and B channel. During switch on this register is loaded with the preset gain setting of subaddress 23H to 25H and when necessary it will be adapted by the CCC control loop. These registers have a resolution of 7 bits. The control of the gain setting is illustrated in table below.

WPR(GB)	'0'	B5	B4	B3	B2	B1	B0	Max 64
CL	'0'	B3	B2	B1	B0	'0'	'0'	Max 60

R(GB)-gain	B6	B5	B4	B3	B2	B1	B0	Max 126

The setting of the gain registers of the 3 channels can be stored during switch off and can be loaded again during switch-on so that the drive conditions are maintained.

When required the operation of the CCC system can be changed into a one-point black current system. The switching between the 2 possibilities is realised by means of the EGL bit (EGL = 0) in subaddress 42H. When used as one-point control loop the system will control the black level of the RGB output signals to the 'low' reference current and not on the cut off point of the cathode. In this way spreads in the picture tube characteristics will not be taken into account. In this condition the settings of the "white point control registers" (subaddress 20H-22H) and the "cathode drive level bits" (CL3 - CL0 in subaddress 42H) are added to the settings of the RGB preset gain registers (subaddress 23H - 25H).

A black level off-set can be made with respect to the level which is generated by the black current stabilization system. In this way different colour temperatures can be obtained for the bright and the dark part of the picture. The black level control is active on the Red and the Green output signal. It is also possible to control the black level of the Blue and the Green output signal (OFB bit = 1).

In the Vg2 adjustment mode (AVG=1) the black current stabilization system checks the output level of the 3 channels and indicates whether the black level of the highest output is in a certain window (WBC-bit) or below or above this window (HBC-bit). This indication can be read from the status byte 01 and can be used for automatic adjustment of the Vg2 voltage during the production of the TV receiver. During this test the vertical scan remains active so that the indication of the 2 bits can be made visible on the TV screen.

The control circuit contains a beam current limiting circuit and a peak white limiting circuit. The control is realised by means of a reduction of the contrast and brightness control settings. The way of control (first contrast and then brightness or contrast and brightness in parallel) can be chosen by means of the CBS bit (subaddress 44H). The peak white level is adjustable via the I2C-bus.

To prevent that the peak white limiting circuit reacts on the high frequency content of the video signal a low-pass filter is inserted in front of the peak detector. The circuit also contains a soft-clipper which prevents that the high frequency peaks in the output signal become too high. The difference between the peak white limiting level and the soft clipping level is adjustable via the I2C-bus in a few steps.

During switch-off of the TV receiver a fixed beam current is generated by the black current control circuit. This current ensures that the picture tube capacitance is discharged. During the switch-off period the vertical deflection can be placed in an overscan position so that the discharge is not visible on the screen.

A wide blanking pulse can be activated in the RGB outputs by means of the HBL bit in subaddress 43H. The timing of this blanking can be adjusted by means of the bits WBF/R bits in subaddress 26H.

### 5.2.11 I2C-BUS USER INTERFACE DESCRIPTION

The UOC III series is fully controlled via the I2C-bus. Control is exercised by writing data to one or more internal registers. Status information can be read from a set of info registers to enable the controlling microcontroller determine whether any action is required. The device has an I2C-bus slave transceiver, in accordance with the fast-mode specification, with a maximum speed of 400 kbits/s. Information concerning the I2C-bus can be found in brochure "I2C-bus and how to use it" (order number 939839340011). To avoid conflicts in a real application with other ICs providing similar or complementary functions, there are two possible slave addresses available which can be selected by the SVM pin(pin 65).

#### Possible slave address

SVM PIN	SLAVE ADDRESS A6 TO A0
Scavem application	1 0 0 0 1 0 1
Tied 5 volts	1 0 0 0 1 1 1

The device will not respond to a 'generalcall' on the I2C-bus, i.e. when a slave address of 0000000 is sent by a master.

#### Write registers

Each address of the address space (see below) can only be written.

Correct operation is not guaranteed if registers in the range \$FB to \$FF will be addressed!

#### Read registers

The output registers of the TV processor are only available via auto-increment mode, no address can be used and all registers must be read.

## 5.3 GENERAL DESCRIPTION OF THE TV SOUND OF SOUND PROCESSOR

The TV Sound Processor is a digital TV sound processor for analog multi-channel sound systems in TV sets. It is based on a 24 bit DSP and designed to support several applications.

A new easy-to-use control concept was implemented for easiest configuration programming of the very complex functionality of the TV Sound Processor. Pre-defined setups are available for all implemented sound processing modes. Aloud speaker switching concept allows it to adapt the pre-defined setups to the specific loudspeaker application. The built-in intelligence for pre-defined standards and Auto Standard Detection (ASD) allows an easy setup of the demodulator and decoder part.

The control concept for the audio processor is based on the following new features:

- Pre-defined setups for the sound processing modes like Dolby®Pro Logic®and Virtual Dolby®Surround (422, 423)
- Flexible configuration of audio outputs to the loudspeaker configuration with an additional output crossbar
- Master volume function

The control concept for the demodulator and decoder (DEMDEC) is based on the following new features:

- Easy demodulator setup for all implemented standards with Demodulator and Decoder Easy Programming (DDEP) for a pre-selected standard or combined with Auto Standard Detection (ASD) for automatic detection of a transmitted standard

- Automatic decoder configuration and signal routing depending on the selected or detected standard
- FM overmodulation adaptation option to avoid clipping and distortion

### 5.3.1 Supported standards

The multistandard capability of the TV Sound Processor covers all terrestrial TV sound standards, FM Radio and satellite FM.

The AM sound of L/L' standard is normally demodulated in the 1st sound IF. The resulting AF signal has to be entered into the mono audio input of the TV Sound Processor. A second possibility is to use the AM demodulator in the DEMDEC part, however this may result in limited performance.

Korea has a stereo sound system similar to Europe. It is supported by the TV Sound Processor. Differences include deviation, modulation contents and identification. It is based on M standard.

#### Other features of the DEMDEC are:

- M/BTSC and N standards supported
- M/Japan (EIAJ) supported
- FM Radio stereo decoding
- Alignment-free, fully digital system
- For BTSC full dbx® performance
- SAP demodulation (without dbx®) simultaneously with stereo decoding, or mono plus SAP with dbx®
- Line/pilot frequency selectable from 15.734 kHz and 15.625 kHz (or automatic detection / auto search)
- High selectivity for pilot detection, high robustness against high-frequency audio components
- Pilot lock indicator
- SAP detector
- Separate noise detectors for stereo and SAP with adjustable threshold levels, hysteresis, and automute function

An overview of the supported standards and sound systems and their key parameters is given in the following tables.

The analog multi-channel sound systems (A2, A2+ and A2\*) are sometimes also named 2CS (2 carrier systems).

### ANALOG 2-CARRIER SYSTEMS

[Table] Frequency modulation

STANDARD	SOUND SYSTEM	CARRIER FREQUENCY (MHz)	FM DEVIATION(kHz) NOM./MAX./OVER	MODULATION		BANDWIDTH/ DE-EMPHASIS (kHz/us)
				SC1	SC2	
M	Mono	4.5	15/25/50	Mono	-	15/75
M	A2+	4.5/4.724	15/25/50	1/2(L+R)	1/2(L+R)	15/75(Korea)
B/G	A2	5.5/5.742	27/50/80	1/2(L+R)	R	15/50
I	Mono	6.0	27/50/80	mono	-	15/50
D/K(1)	A2*	6.5/6.258	27/50/80	1/2(L+R)	R	15/50
D/K(2)	A2*	6.5/6.742	27/50/80	1/2(L+R)	R	15/50
D/K(3)	A2*	6.5/5.742	27/50/80	1/2(L+R)	R	15/50

[Table] Identification for A2 systems

PARAMETER	A2/A2*	A2+ (KOREA)
Pilot frequency	54.6875kHz = 3.5 x line freq.	55.0699 kHz = 3.5 x line freq.
Stereo identification frequency	117.5 Hz = line freq / 133	149.9 Hz = line freq / 105
Dual identification frequency	274.1 Hz = line freq / 57	276.0 Hz = line freq / 57
AM modulation depth	50%	50%

Note 1. See ' EBU specification' or equivalent specification.

## 5.4 FUNCTIONAL DESCRIPTION SOUND PROCESSOR

### 5.4.1 The UOC III TV Sound Concept

The UOCIII sound concept is implemented over the video processor and TCG-microcontroller.

Only relevant blocks, functions and signal flows for sound are given.

(only relevant blocks, functions and signal flow for sound are shown)

The tuner receives a RF signal and converts it to IF. Via appropriate SAW filters the SIF signal is delivered to the QSS stage of the video processor and if channels according to standard L/L' are received also to the AM demodulator. The Quasi Split Sound demodulation generates the SSIF or intercarrier signal. By the SSIF switch it is possible to choose between the internally derived

intercarrier and an external second SIF(2NDSIFEXT), e.g. an intercarrier coming from a PIP frontend. In other applications a 10.7MHz radio IF or satellite FM may be connected to this input. The selected SSIF passes some anti alias filtering, is amplified in an AGC amplifier (SSIF AGC) and is then converted from analogue to digital (SSIF ADC).

The audio signal out of the AM demodulator is connected to the analogue crossbar at the video processor. All other inputs to this multiplexer/audio switch come from external, either from a PIP frontend or SCART/CINCH(AUDINx) or the DAC output signals from the digital controller. The audio AD converters are digitising the audio signals foreseen for further digital processing. One stereo output (AUDOUTS) is available for connections to SCART/CINCH sockets.

The sound part on the digital controller consists of the demodulator/decoder(DEMDEC), a digital input crossbar, the digital audio processing for the loudspeaker and DAC channels, the I2S processing and interfacing, a digital output crossbar as well as the DA conversion.

An auxiliary audio control (volume control, AUX audio contr.) is available on the video processor. Here it is applied to the headphone channel.

The part of the concept located in the digital controller will be described in the next chapters.

### 5.4.2 Functional Overview Of the digital controller sound part

The digital controller sound part consists of the SSIFADC, audio ADCs, DEMDEC HW, the sound DSP core, audio DACs and I2S interface hardware as shown in fig below. The DEMDEC part of the Sound DSP is used for the decoder and partly demodulator tasks. The AUDIO part provides the sound features, from the level adjust unit up to the output crossbar. Audio DACs and I2S hardware are converting the processed signals to analogue or digital audio.

The SSIF signal is applied to the SSIF ADC for conversion and is then fed to the DEMDEC hardware processing mainly for demodulation but also some decoding tasks. Remaining

decoding is done in the DEMDEC block of the Sound DSP. The DEMDEC processing will be described in the next chapter.

The audio signals (AUD ADC IN) from the analogue crossbar pass the audio ADC and are fed directly into the AUDIO part of the Sound DSP like the I2S signals, which is coming from I2S processing hardware. After level adjust all signals from the DEMDEC and the I2S input are available at the digital input crossbar. A special input is provided for the Noise/Silence Generator needed for olby®Pro Logic®processing.

In standard TV applications the main channel signal(L,R) will be connected to the DAC2 for reproduction at the speakers. With multichannel signals centre, surround or subwoofer channels may be passed to the I2S outputs where external DACs may be applied. By this it is possible to build Dolby Normal/Wide, Dolby Phantom Centre or Dolby 3 Stereo set-ups and also a VDS423 application.

### **5.4.3 Demodulator and decoder**

#### **INTRODUCTION**

The TV sound processor provides an easy-to-use programming interface and built-in intelligence for the demodulator and decoder part.

The sound demodulator is able to search for sound carriers and react to transmission mode changes autonomously, without interaction of the micro controller software.

It is possible for a typical terrestrial TV application to setup the entire demodulator with transmission of few control words.

The control interface still allows access to every detail, called demodulator expert mode, for special applications such as satellite TV, more elaborated search algorithms etc.

The new TV Sound ProcessorDemodulator and DecoderEasyProgramming(DDEP)interfaceprovides three possible approaches to setup the demodulator and decoder parts:

- Auto Standard Detection (ASD)
- Static Standard Selection (SSS)
- Demodulator and Decoder Expert Mode (DDXM)

#### **MIXER**

The digitized 2nd SIF input signal is fed to the mixers, which mix one or both input sound carriers down to zero IF. The mixer frequency is derived by the standard setting (Easy Programming) or in the Demodulator and Decoder Expert Mode (DDXM) by a 24-bit control word for each carrier. For NICAM demodulation, a feedback signal is added to the control word of the second carrier mixer to establish a carrier-frequency loop.

#### **FMANDAMDEMODULATION**

An FM or AM input signal is fed via a band-limiting filter to a one of two demodulators that can be used for either FM or AM demodulation. Four filters with different bandwidth are available. The

output signal of the first demodulator can be used for further demodulation of multiplex signals used in the BTSC, EIAJ and FM Radio standards.

## **FMIDENTIFICATION**

The identification of the FM sound mode is performed by AM synchronous demodulation of the pilot signal and narrow-band detection of the identification frequencies. The result is available via the control bus interface. A selection can be made for three different modes that represent different trade-offs between speed and reliability of identification. The mode is set by DDEP (for FM two-carrier standards) or via expert mode. DDEP also performs automatic FM de-matrix control in dependence on the identification.

## **FM/AMDECODING**

A high-pass filter suppresses DC offsets from the FM/AM demodulators due to carrier frequency offsets and supplies the monitor/peak function with DC values and an un-filtered signal, e.g. for the purpose of carrier detection.

The audio bandwidth is approx. 15 kHz.

The de-emphasis function offers fixed settings for the supported standards (50s, 60s, 75s and J17).

A matrix performs the de-matrixing of the A2 stereo, dual and mono signals to obtain the left (L) and right (R) or language A and B signals.

## **FMPILOTARRIERPRESENTDETECTOR**

The TV Sound Processor provides FM A2 standard pilot carrier detection.

## **NICAMDEMODULATION**

The NICAM signal is transmitted via DQPSK modulation at a bit rate of 728kBit/s. The NICAM demodulator performs DQPSK demodulation and feeds the resulting bit stream and clock signal to the NICAM decoder.

A timing loop controls the sample rate conversion circuitry to lock the sampling rate to the symbol timing of the NICAM data.

## **NICAM DECODER**

The NICAM decoder performs all decoding functions in accordance with the EBU NICAM 728 specification. After locking to the frame alignment word, the data is de-scrambled by applying the defined pseudo-random binary sequence; the NICAM decoder will then synchronize to the periodic frame flag bitC0.

The status of the NICAM decoder can be read out from the NICAM status register by the user (see the control-bus register description). The OSB bit indicates that the decoder has locked to the NICAM data. The VDSP bit indicates that the decoder has locked to the NICAM data and that the data is valid sound data. The C4 bit indicates that the sound conveyed by the FM mono channel is identical to the sound conveyed by the NICAM channel. The error byte contains the

number of sound sample errors, resulting from parity checking, that occurred in the past 128ms period. The Bit Error Rate (BER) can be calculated using the following equation;

$$\text{BER} = \frac{\text{bit errors}}{\text{total bits}} \approx \text{error byte} \times 1.74 \times 10^{-5}$$

During NICAM mode a switchable J17 de-emphasis is supplied.

## **NICAM AUTO-MUTE**

If the Auto Standard Detection (ASD) or the Static Standard Detection (SSS) feature is activated the following auto mute function is in effect.

If NICAM B/G, I, D/K is received, the auto-mute is enabled and the signal quality becomes poor, the built-in control automatically switches the output signal (DEC output) to FM channel 1. The automatic switching depends on the NICAM bit error rate. The auto-mute function can be disabled via the control bus.

This function is enabled by setting bit NIC\_AMUTE to 0. Upper and lower error limits may be defined by writing appropriate values to the corresponding control bits (NICLOERRLIM and NICUPERRLIM). When the number of errors in a 128 ms period exceeds the upper error limit the auto-mute function will switch the output sound from NICAM to whatever sound is on the first sound carrier (FM or AM). When the error count is smaller than the lower error limit the NICAM sound is restored.

The auto-mute function can be disabled by setting bit NIC\_AMUTE to 1. In this condition clicks become audible when the error count increases; the user will hear a signal of degrading quality.

For NICAM L applications, it is recommended to demodulate AM sound in the first sound IF. The demodulated AM is provided by the internal IF processor. For applications with external IF processing the external demodulated AM signal can be connected to the SCART/Mono input of the TV Sound Processor. By setting the EXTAM bit, the auto-mute function will switch to the audio ADC input signal named EXTAM instead of switching to the first sound carrier. The ADC source selector should be set to internal AM mono signal or to the external SCART/mono input, where the AM sound signal should be connected.

## 6. SERVICE PARTS LIST

Caution : In this Service Manual, some parts can be changed for improving, their performance without notice in the parts list. So, if you need the latest parts information, please refer to PPL(Parts Price List) in Service Information Center(<http://svc.dwe.co.kr>)
